## Introduction

---

### Background

Over the last year, electricity prices have been significantly higher than before. Prices started rising rapidly in summer of 2021 when Russia reduced its gas supplies to Europe while global demand picked up as COVID-19 restrictions were eased. Subsequently, Russia's invasion of Ukraine and its weaponisation of energy sources have led to substantially lower levels of gas delivery to the EU and increased disruptions of gas supply, further driving up the price. This has had a severe impact on EU households and the economy. High gas prices influence the price of electricity from gas fired power plants, often needed to satisfy electricity demand.

In the immediate reaction to global dynamics, the EU provided an energy prices toolbox with measures to address high prices (including income support, tax breaks, gas saving and storage measures). The subsequent weaponisation of gas supply and Russia's manipulation of the markets through intentional disruptions of gas flows have led not only to skyrocketing energy prices, but also to endangering security of supply. To address it, the EU had to act to diversify gas supplies and to accelerate energy efficiency and the deployment of renewable energy.

Following the Russian invasion of Ukraine in February 2022, the EU responded with REPowerEU - a plan for the Union to rapidly end its dependence on Russian energy supplies by strengthening the European resilience and security, reducing energy consumption, accelerating the roll-out of renewables and energy efficiency, and securing alternative energy supplies. The EU also established a temporary State Aid regime to allow certain subsidies to soften the impact of high prices. Further, to address the price crisis and security concerns, the EU has agreed and implemented a strong gas storage regime, effective demand reduction measures for gas and electricity, and price limiting regimes to avoid windfall profits in both gas and electricity markets.

### The EU Electricity Market Design

The current electricity market design has delivered a well-integrated market, allowing Europe to reap the economic benefits of a single energy market in the normal market circumstances, ensuring security of supply and sustaining the decarbonisation process. Cross-border interconnectivity also ensures safer, more reliable and efficient operation of the power system.

Market design has also helped the emergence of new and innovative products and measures on retail electricity markets – supporting energy efficiency and renewable uptake and helping consumers reduce their energy bills also through emerging services for providing demand response. Building on and seizing the potential of the digitalisation of the energy system, such as active participation by consumers, will be a key element of our future electricity markets and systems.

In the context of the energy crisis, the current electricity market design has however also demonstrated a number of shortcomings. The reforms the Commission will undertake will address those shortcomings and ensure stable and well-integrated energy markets, which continue to attract private investments at a sufficient scale as an essential enabler of the European Green Deal objectives and the transition to a climate neutral economy by 2050.

In addition to these shortcomings, the European electricity sector is facing a number of more long-term challenges triggered by the rising shares of variable renewable energy and the progressive drive towards full decarbonisation by 2050. This includes ensuring investments, not just as regards renewables but also as regards weather independent low-carbon technologies until large scale storage and other flexibility tools become available. Stronger locational price signals in the system may be needed to ensure that the investments take place where they are needed, reflecting the physical reality of the electricity grid whilst at the same time ensuring incentives for cross-border long-term contracting. Some of these challenges will require ongoing policy reflections going beyond the scope of the current reform.

### **Making Electricity Bills More Independent from the Short-Term Cost of Fossil Fuels**

The strong focus of the current market design on short-term markets, still very often determined by volatile fossil fuel prices, has exposed households and companies to significant price spikes with effects on their electricity bills. Many consumers found they had no option but to pay higher electricity prices driven by wholesale gas prices – either because they had no access to electricity cheaper electricity from renewable sources or could not install solar panels themselves.

The current regulatory framework regarding long-term instruments has proven insufficient to protect large industrial consumers, SMEs and households from excessive volatility and higher energy bills.

The gas price increase together with the strong role that short-term markets play in today's electricity market design have also boosted the revenues and profits well beyond the expectations of many generators with lower marginal costs such as renewables and nuclear ("inframarginal generators"), while receiving – in some cases - public support as well.

Short-term markets remain essential for the integration of renewable energy sources in the electricity system, to ensure that the cheapest form of electricity is used at all times, and to ensure that electricity flows smoothly between Member States. Whilst short-term price spikes can in general incentivize consumers to reduce or shift their demand, sustained high prices over a longer period translate into

unaffordable bills for many consumers and companies.

This is why there is a need to complement the regulatory framework governing these short-term markets with additional instruments and tools that incentivise the use of long-term contracts to ensure that the energy bills of European consumers and companies - and the revenues of inframarginal generators - become more independent from the fluctuation of prices in short-term markets (often driven by fossil fuel costs) and thus more stable over longer periods of time. The reforms should create a buffer between consumers and short-term markets, ensuring that they will be better protected from extreme prices and that electricity bills better reflect the overall electricity mix and the lower cost of generating electricity from renewables. Electricity bills across Europe should depend less on the short-term markets, with an increasing share of consumers shifting into more stable and affordable longer-term pricing arrangements.

There are two main types of long-term contracts which allow to pass on the benefits of renewables to all consumers. One is power purchase agreements (PPAs) between private parties which ensure that electricity is sold on a long-term basis at an agreed price, therefore not determined by short-term markets. Power purchase agreements bring multiple benefits. For consumers, they provide cost competitive electricity and hedge against electricity price volatility. For renewable projects developers, they provide a source of stable long-term income. For governments, they provide an alternative avenue to the deployment of renewables without the need for public funding. Although power purchase agreements are becoming more widespread in the EU and the Renewable Energy Directive obliges the Member States to remove unjustified barriers to their development, the overall market share of power purchase agreements remains limited. The growth of power purchase agreements is concentrated in some Member States only and confined to large companies.

The Commission will suggest ways in which the share of PPAs in the overall electricity market can be increased and their roll-out incentivised through the market design. The uptake of power purchase agreements, in particular by small and medium companies, can, for example, be more widely promoted by public tendering for renewable energy in which a share of a project could be contracted through power purchase agreements. Credit guarantees to power purchase agreements backed by public actors could be considered as a form of support that could efficiently drive the emergence of a power purchase agreement market. Potentially, measures could be considered to ensure that industrial consumers use the full potential of power purchase agreements to lower their exposure to short-term markets and that energy suppliers more actively enter into the power purchase agreement market.

The other type of long-term contracts applies where public support is needed to trigger investments, so-called two-way contracts for difference ("two-way CfDs"). These contracts ensure that the income of the generators in question (and the corresponding cost for consumers) provides an adequate incentive to invest and is less dependent on short-term markets. These contracts for difference are typically established by a competitive tender process, allowing support to be channelled to the projects with the lowest expected production costs. In situations of very high prices two-way CfDs would provide Member States with additional funds for reducing the impact of high electricity prices on consumers.

The upcoming reform offers an opportunity to present ways in which two-way CfDs can be integrated into the electricity market design. A number of issues need to be considered in this context, notably as to the extent to which the use of CfDs becomes mandatory for investments involving public support and whether the use of such contracts should only cover new generation assets entering the market or also certain types of existing generation assets.

In any case, given the multiple benefits of the power purchase agreements, the actions of the reform concerning the CfDs should not affect the development of the power purchase agreement market across the EU. Both instruments are necessary complements to achieve the necessary deployment of renewables.

- The simplest way to introduce two-way CfDs would be to complement the existing principles for support schemes with the specific ones to govern such contracts in the regulatory framework, with Member States deciding whether or not to use these instruments to drive new investments in inframarginal generation.
- A more binding way to anchor these contracts in the regulatory framework would be to require that all investments involving the use of public support rely on such contract structures. This would need to be carefully calibrated to ensure that CfDs provide the necessary incentives at the least cost for consumers.
- Another option would be to not only envisage the use of CfDs for new generation but also to allow Member States to offer contracts on certain types of existing inframarginal generators (e.g., for specific types of technologies). These contracts could be awarded to existing generation, where possible, on the basis of competitive bidding.
- A more far-reaching approach would be to not only envisage the use of CfDs for new generation but also to allow Member States to impose these contracts on certain types of existing inframarginal generators (e.g., for specific types of technologies). Contrary to the situation for new generation, the contracts for these types of existing generators would typically not result from market-based tendering but would result from ex-post price regulation. Whilst this would accelerate the uptake of contracts for difference, it would also create significant uncertainty for investors in renewables. This could risk the necessary investments in this type of generation, increase the costs of those investments and as a result be counterproductive.

## **Driving Renewable Investments – Europe’s Way Out of the Crisis**

Increasing renewable energy deployment as well as electrification in general, is critical for Europe’s security of supply, the affordability of energy and achieving climate neutrality by 2050. The accelerated deployment of renewables and energy efficiency measures will structurally reduce demand for fossil fuels in the power, heating and cooling, industry and transport sectors. Thanks to their low operational costs, renewables can lower energy prices across the EU. Furthermore, faster deployment of renewable energy will contribute to EU’s security of energy supply.

Any regulatory intervention in the electricity market design therefore needs to preserve and enhance the incentives for investments and provide investors with certainty and predictability, while addressing the economic and social concerns related to high energy prices.

## **Alternatives to Gas to Keep the Electricity System in Balance**

The consultation also covers ways to improve the conditions under which flexibility solutions such as demand response, energy storage and other weather independent renewable and low carbon sources, compete in the markets. These include measures aimed at incentivising the development of such flexibility solutions in the market (such as adapting the tariff design of system operators to ensure that they fully consider all flexibility solutions and use the existing network as efficiently as possible, allowing for access to more detailed data from electricity consumers through the installation of submeters or developing products

to reduce demand or shift energy consumption in periods of high demand or prices) and targeted measures to improve the efficiency of the short-term markets, with particular focus on the intraday market (such as allowing trading across Member States closer to the delivery of electricity and further increasing the liquidity in this market). In addition, the consultation seeks input on how to safeguard security of supply and adequacy also in situations of unforeseen crisis to ensure timely investments in capacity.

Combined with renewable generation and enhanced investments in grid capacity and inter-connectivity, this should contribute to reducing the role that natural gas-fired generation plays as a flexible source of generation and will, over time, replace, and thereby, phase out natural gas-fired power generation in line with the EU's decarbonisation targets.

### **Lessons Learned from Short Term Market Interventions**

During the crisis, a number of emergency and temporary market interventions have been introduced to mitigate the impact of high energy prices on consumers and companies. In the electricity market, the measure introduced at EU level is the so-called inframarginal cap, which softened the impact of high prices whilst requiring mandatory demand reduction.

The consultation seeks stakeholders' views on whether certain aspects of these emergency interventions could be turned into more structural features of the electricity market design, for example activated in future crisis situations, and if so, under what conditions.

Any such potential element of the reform would depend on the success of these measures in terms of limiting the impact of high electricity prices and on whether they can be introduced without harming the investment incentives required to achieve the decarbonisation of the power sector.

### **Better Consumer Empowerment and Protection**

The energy crisis has exposed consumers across the internal market to higher energy costs – resulting in a real lowering of their standard of living. In some cases, customers face a choice between paying for their energy and buying other essential goods[1][2]. The crisis has also hit industry and service sectors increasing energy costs, particularly for energy intensive industry. This has given rise to cuts in production capacity, temporarily or permanent closures and lay-offs.

The Electricity Directive has not yet been fully implemented. Better implementation, and enforcement of consumer rights, would have helped mitigate the impact of the crisis for consumers. However, targeted improvements are also needed. This consultation covers different options for creating a buffer between consumers and short-term energy markets.

By giving consumers who want to actively participate in energy markets more opportunities to do so, including by sharing energy to control their costs[3]. We can also better use digitalisation tools to make it easier for consumers with renewable heating or electromobility to manage their costs through avoiding the most expensive times of the day to use grid electricity. Even without being active on the market consumers need to be able to access longer term contracts for electricity, notably based on renewable power purchase agreements between suppliers and renewable producers. This will allow them to manage their costs and support new investments in renewable energy.

The crisis has also shown that often consumers pick up the costs when suppliers fail. This could be mitigated by requiring suppliers to be adequately hedged, combined with an effective Supplier of Last Resort Regime to ensure continuity of supply.

Finally, in cases of crisis it may be worthwhile enabling Member States to guarantee households and SMEs access to a minimum necessary amount of electricity at an affordable price, as was done in the Council Regulation (EU) 2022/1854 of 6 October 2022 on an emergency intervention to address high energy prices.

### **Stronger Protection against Market Manipulation**

Regulation 1227/2011 on wholesale market integrity and transparency (REMIT) ensures that consumers and other market participants can have confidence in the integrity of electricity and natural gas markets, that prices reflect a fair and competitive interplay between supply and demand, and that no profits can be drawn from market abuse. In times of very high price volatility, external actors' interference, reduced supplies, and new trading behaviours, there is a risk that entities engage in illegal wholesale trading practices. There is therefore a need to ensure that the REMIT framework is up to date and robust. Further improvements would increase transparency, monitoring capacities and ensure more effective investigation and enforcement of cross-border cases in the EU to support new electricity market design.

### **Next Steps**

The aim of the present public consultation is to give the opportunity to all stakeholders and other interested parties to provide feedback on a series of policy objectives to be pursued by the reform proposal and possible concrete legislative and non-legislative measures resulting from them.

The Commission intends to present a proposal for amendments to the electricity market design in March 2023. The replies to the present consultation should be provided by 13 February 2023 at the latest.

[1] See European Pillar of Social Rights, principle 20, and also the upcoming first EU Report on Access to Essential Services.

[2] See notably the Eurobarometer on "Fairness perceptions of the green transition", 10 October 2022

[3] Examples include allowing families to share energy among the different members located in different parts of the country; farmers installing renewable generation on one part of their farm and using the energy in their main buildings even if located a distance away; municipalities and housing associations including off-site energy as part of social housing, directly addressing energy poverty. Electricity production and consumption would need to take place at the same time which can be ensured by the use of smart metering.

Making Electricity Bills Independent of Short-Term Markets

---

Subtopic: Power Purchase Agreements (PPAs)

---

The conclusion of PPAs between electricity generators and final customers (including large industrial customers, SMEs and suppliers), is a way of supporting long-term investment by providing both parties with certainty regarding the price level over a longer time horizon (typically, 5 to 20 years) compared to other alternatives. In particular, PPAs contribute to reduce the uncertainty of final customers concerning electricity prices and their exposure to price variations, allowing to make consumers' bills independent from the fluctuation of fossil fuels prices. However, as PPAs are contracts signed over a long period of time, they bear considerable risks and costs for smaller market participants. Hence, their accessibility is currently limited to a few large final customers (e.g. energy intensive undertakings), creating a risk that access to decarbonised generation is limited to a subset of consumers.

Whilst the uptake of renewable PPAs is growing year-on-year, the market share of projects marketed under renewable power purchase contracts covers still only 15-20% of the annual deployment. Furthermore, renewable PPAs are limited to certain Member States and large undertakings, such as energy intensive undertakings.

To address these barriers, Member States can consider ways of supporting the conclusion of PPAs in line with State Aid rules. The Commission has described in detail the additional measures that could help the development of renewable PPAs in the Commission Staff Working document accompanying the REPowerEU Communication[1]. This could be achieved, inter alia, by pooling demand in order to give access to smaller final customers, by providing State guarantees in line with the State Aid Guarantee Notice [2] and by supporting the harmonization of contracts in order to aggregate a larger volume of demand and enable cross-border contracts.

[1] Commission Staff Working Document Guidance to Member States on good practices to speed up permit-granting procedures for renewable energy projects and on facilitating Power Purchase Agreements Accompanying the document Commission Recommendation on speeding up permit-granting procedures for renewable energy projects and facilitating Power Purchase Agreements SWD/2022/0149 final

---

Do you consider the use of PPAs as an efficient way to mitigate the impact of short-term markets on the price of electricity paid by the consumer, including industrial consumers?

- ☒ Yes
- ☐ No

Please describe the barriers that currently prevent the conclusion of PPAs.

*2000 character(s) maximum*

Tänaused takistused PPAdel läbiviimisel:

- Energiakriisist tulenev ebakindlus on mõjunud PPAdel sõlmimisele negatiivselt. Tõusnud on tagatiste suurused ja tootjate ootus saadavale hinnale.
- Inframarginaalsetele tootjatele seatud hinnalagi on täiendavalt tekitanud ebakindlust ja vähendanud usaldust turu vastu.
- Eestis pole suuremahulistele PPAdel piisava tarbimisega tarbijad vastas.

Do you consider that the following measures would be effective in strengthening the roll-out of PPAs?

*at most 6 choice(s)*

- ☒ a) Pooling demand in order to give access to smaller final customers
- ☐ b) Providing insurance against risk(s) either market driven or through publicly supported guarantees schemes (please identify such risks)
- ☐ c) Promoting State-supported schemes that can be combined with PPAs
- ☐ d) Supporting the standardisation of contracts
- ☐ e) Requiring suppliers to procure a predefined share of their consumers' energy through PPAs
- ☐ f) Facilitating cross-border PPAs

Do you have additional comments?

*2000 character(s) maximum*

Piiriülesed PPA-d läbiviimise eelduseks on riikide vahel ühtne hinnapiirkond ja piisavate ülekandevõimsuste olemasolu.

In addition to the measures proposed in the question above, do you see other ways in which the use of PPA for new private investments can be strengthened via a revision of the current electricity market framework?

- ☒ Yes
- ☐ No

If yes, please explain which rules should be revised and the reasons.

*2000 character(s) maximum*

Avalik sektor saab eeskuju näidata, sõlmides ise PPA-sid.

Do you see a possibility to provide stronger incentives to existing generators to enter into PPAs for a share of their capacity?

- ☐ Yes
- ☒ No

Please explain

*2000 character(s) maximum*

PPA-de sõlmimine peaks toimuma turupõhiselt.

Do you consider that stronger obligations on suppliers and/or large final customers, including the industrial ones, to hedge their portfolio using long term contracts can contribute to a better uptake of PPAs?

- ☐ Yes  
☒ No

Do you consider that increasing the uptake of PPAs would entail risks as regards

	Yes	No
(a) Liquidity in short-term markets	<input type="radio"/>	<input checked="" type="radio"/>
(b) Level playing field between undertakings of different sizes	<input checked="" type="radio"/>	<input type="radio"/>
(c) Level playing field between undertakings located in different Member States	<input type="radio"/>	<input checked="" type="radio"/>
(d) Increased electricity generation based on fossil fuels	<input checked="" type="radio"/>	<input type="radio"/>
(e) Increased costs for consumers	<input checked="" type="radio"/>	<input type="radio"/>

If yes, how can these risks be mitigated?

*2000 character(s) maximum*

Eelistada taastuvelektril põhinevaid PPAsid ja tagada PPade osalemine elektriturul hinna kujundamises.  
Väikeste tarbijate tarbimise agregeerimine.

Please explain

*2000 character(s) maximum*

Kindlasti mõjuks kohustus PPAsid edendavalt, kuid seda ei peaks tegema kohustuslikuks korras. Kui PPA on tarbijale piisavalt atraktiivne, siis sõlmitakse ka vastavaid lepinguid. Kohustuslikuks korras PPade sõlmimine võib tuua kaasa hinna kasvu ja suuremad tagatisnõuded.

---

## Subtopic: Forward Markets

---

Organised forward markets are a useful tool for suppliers and large consumers such as energy intensive undertakings to protect themselves against the risk of future increases in electricity prices and to decouple their energy bills from fluctuations of fossil fuel prices in the medium to long-term. However, it has been argued that liquidity in many organised forward markets across the EU is insufficient and that the time horizon for such hedging seems too short (usually up to one year). One possibility to increase the liquidity in forward markets would be to establish virtual trading hubs for forward contracts, as already exist in certain regions.

Such hubs would need to be complemented with liquid and accessible transmission rights to hedge the remaining risk between the hub and each zone.

While hedging up to approximately three years could be improved with better organization of the market, additional measures might be needed to incentivise forward hedging beyond this timeframe (see for example the section above on PPAs).

---

Do you consider forward hedging as an efficient way to mitigate exposure to short-term volatility for consumers and to support investment in new capacity?

- ☒ Yes
- ☐ No

Do you consider that the liquidity in forward markets is currently sufficient to meet this objective?

- ☐ Yes
- ☒ No

Do you have additional comments?

*2000 character(s) maximum*

Tähtis on võimaldada tulevikutehingute turgudel regionaalset paindlikkust pikaajaliste ülekandeõiguste (LTTR-ide) ja asjakohaste virtuaalsete sõlmpunktide valiku osas, nt. Baltikumid kasutavad võrdlushinnana Põhjamaade süsteemihinda. Paindlikkus on oluline, et mitte seada ohtu juba toimivaid lahendusi.

In your view, what prevents participants from entering into forward contracts?

*2000 character(s) maximum*

Täna on ebakindlus turul suur, mis väljendub kõrgetes pikaajalistes hindades ja suurtes nõuetes tagatistele.

In your view, would requiring electricity suppliers to hedge for a share of their supply be beneficial for consumers and for retail competition?

- ☐ Yes
- ☒ No

Do you have additional comments?

*2000 character(s) maximum*

Selline kohustus eeldaks piisavat likviidsust turul, ei peaks olema kohustuslik.

Do you consider that the creation of virtual hubs for forward contracts complemented with liquid transmission rights would improve liquidity in forward markets?

- ☒ Yes
- ☐ No

If yes, do you consider that such virtual hub(s) should be developed at national, regional or EU level?

- ☐ National level
- ☐ Regional level
- ☒ EU level

Do you have additional comments?

*2000 character(s) maximum*

Selline platvorm võiks võimaldada pikaajalistel lepingutel omavahel konkureerida ja pakkuda tarbijatele suuremat valikuvõimalust. Selle rakendamine vajaks sellegipoolest täpsemalt analüüsimist. Oluline on sellisel platvormil tagada likviidsed ülekandeõigused. Kui otsustatakse luua sellised platvormid näiteks regiooniti, on oluline määratleda nendele platvormidele kehtivad ühised nõuded.

Do you have experience with the existing virtual hubs in the Nordic countries?

- ☐ Yes
- ☒ No

Do you have additional comments related to the existing virtual hubs in the Nordic countries?

*2000 character(s) maximum*

In your view, what would be the possible ways of supporting the development of forward markets that could be implemented through changes of the electricity market framework?

*3000 character(s) maximum*

Suuri muudatusi turudisain ei vaja. Pikaajaliste lepingute puhul tuleb tagada, et nii tootjale kui tarbijale säiliks hinnasignaali olemasolu ehk nii tootmine kui tarbimine osalevad turuhinna kujundamisel. Hinnasignaali olemasolu tagab vajaduse energiat säästa, tarbimist juhtida, elektrit salvestada ja taastuvelektri tootmisel arendada. Ilma hinnasignaalist kaob nii tootjal kui tarbijal motivatsioon nii majanduslikes- kui keskkonaaspektides kõige efektiivsemad tehnoloogiad kasutusele võtta, mis omakorda toimib vastassuunas energiatarbimise vähendamise sihile.

## Subtopic: Contracts for Difference (CfDs)

Two-way CfDs and similar arrangements have been used in some Member States to support publicly financed investments in new inframarginal generation (in particular, renewables) to cater for situations

where the necessary investments are not made on a market basis. Similarly to PPAs, they ensure a greater certainty to investors and consumers, and they cater for situations where the necessary investments require public support.

Public support for new inframarginal generation granted in the form of two-way CfDs could ensure that the beneficiaries receive a certain minimum level of remuneration for the electricity produced, while preventing disproportionate revenues. Typically, the beneficiary receives a guaranteed payment equal to the difference between a fixed 'strike' price and a reference price and the revenues above the strike price need to be returned to the CfD counterpart (i.e. Member State).

At the same time, two-way CfDs require the generation supported by the CfDs to pay back the difference between the market reference price and a maximum strike price whenever the reference price exceeds the strike price. If these paybacks are then channelled back to the consumers, suppliers or taxpayers, two-way CfDs also provide them with some protection against excessive prices and volatility, if they are passed on proportionally and objectively.

As it may be difficult for regulators to estimate the actual investment costs, the possibility to determine the remuneration of supported generators through a competitive bidding process is an important instrument to avoid long-lasting excessive costs.

---

Do you consider the use of two-way contracts for difference or similar arrangements as an efficient way to mitigate the impact of short-term markets on the price of electricity and to support investments in new capacity (where investments are not forthcoming on a market basis)?

- ☒ Yes
- ☐ No

Do you have additional comments?

*2000 character(s) maximum*

Should new publicly financed investments in inframarginal electricity generation be supported by way of two-way contracts for differences or similar arrangements, as a means to mitigate electricity price spikes of consumers while ensuring a minimum revenue?

- ☒ Yes
- ☐ No

Do you have additional comments?

*2000 character(s) maximum*

LRdele tuleks võimaldada läbi riigiabiireeglite sellisel viisil taastuvelektri tootmiseseadmete rajamist edendada, kuid kahepoolsed CfDd ei peaks saama kohustuslikuks osaks elektriturudisainist. Turupõhiselt on CfDde sõlmimine täna võimaldatud ja iga LR saab ise vastavalt riigiabi reeglitele ka täna sellisel viisil tootmiseseadmete rajamist toetada. Riigi poolt sõlmitud kahepoolsete CfDde põhiline tulem on taastuvelektri tootmiseseadmete rajamise toetamine, mille omakorda on mõju elektri hinna vähenemisele, kuid kahepoolsed CfDd iseenesest ei peaks olema instrument, mille eesmärk on elektrihinna stabiliseerimine -> elektrihind stabiliseerub piisava tootmisvõimsuse lisandumisel turule, mida kahepoolsed CfDd saavad võimaldada.

## What power generation technologies should be subject to two-way contracts for difference or similar arrangements?

*2000 character(s) maximum*

Kahepoolsed CfDd peaksid olema tehnoloogianeutraalsed ja võtma arvesse EL pikaajalisi kliimaeesmärke ja riiklike vajadusi. Tuule- ja päikeseenergiaühenduste kõrval võiksid olla toetatud ka juhtitavad võimsused näiteks säästlikku biomassi kütusena kasutavad koostootmisjaamad või üleminekukütuseid kasutavad tootmisvõimsused.

## Why should those technologies be subject to two-way contracts for differences or similar arrangements?

*2000 character(s) maximum*

Liikmesriikide eripärad ja võimalused elektrit toota on erinevad ning sõltuvad mitmetest teguritest sh liikmesriigi asukohast, ülekandevõimsustest. Seetõttu ei ole mõistlik tehnoloogiapõhiselt elektrituru regulatsioonis selliseid nõudeid ette kirjutada. Tururegulatsioon peaks tagama võimaluse kõigil sobivatel tehnoloogiatel turul osaleda, võttes arvesse elektri tootmise kulusid ja EL pikaajalisi kliimaeesmärke.

## What technologies should be excluded and why?

*2000 character(s) maximum*

Kahepoolsed CfDd peaksid olema tehnoloogianeutraalsed.

## What are the main risks of requiring new publicly supported inframarginal capacity to be procured on the basis of two-way contracts for difference or similar arrangements, for example as regards of the impact in the short-term markets, competition between different technologies, or the development of market based PPAs?

*2000 character(s) maximum*

Kahepoolne CfD võib võtta tootjal ära motivatsiooni osaleda reguleerimisturul, ehk väheneb reguleerimisturu likviidsus ja tekib risk varustuskindlusele.

Kohustuslikus korras kahepoolsete CfDde sõlmimine võib tuua kaasa turupõhiselt taastuvelektri tootmiseseadmete rajamise vähenemise, kuna arendajad ootavad võimalust saada riikliku garantiid ka tootmiseseadmetel mis turupõhiselt tasuvad on.

Kohustuslikus korras kahepoolsete CfDde sõlmimine võib tuua kaasa ka turuhinna langemise näiteks suviti tasemele, kus tarbijad peavad tootjatele kokku lepitud hinna kompenseerima, kuid muudel perioodidel näiteks talvel, kui hind on kõrge, siis tootja ei tooda ja ei pea tarbijale midagi tagasi maksma ehk pikaajalist

hinnavõitu tarbija ei saa (ennekõike on selline variant võimalik kahepoolsete CfDde sõlmimisel päikesejaamadega).

What design principles could help mitigate the risks identified in your reply to the question above, in particular, in terms of procurement principles and pay out design? Should these principles depend on the technology procured?

*2000 character(s) maximum*

Kahepoolse CfD puhul tagada ennekõike juhitavatel tootmisüksustel motivatsioon osaleda reguleerimisturul ja planeerida hooldused perioodidele, mil elektrinõudlus on madalam. Kahepoolsed CfDd peavad olema riigile vabatahtlikud ja konkreetsed tingimused liikmesriigi kujundada, et vältida näiteks kindla tehnoloogia eelistamist liikmesriigis, kus selle tehnoloogia poolne täiendav tootmine võib negatiivselt mõjuda süsteemi stabiilsusele. Liikmesriik saab sel juhul ise otsustada kas skeemi rakendamine on vajalik turutõrgete eemaldamiseks ja milliseid täiendavaid nõudeid lepingus kajastatakse (nt kohustus osaleda paindlikkusteenuste pakkumisel või kohustus tagada näiteks salvestamise võimekus).

How can it be ensured that any costs or pay-out generated by two-way CfDs in high-price periods are channelled back to electricity consumers? Should a default approach apply, for example, should these revenues or costs be allocated to consumers proportionally to their electricity consumption?

*2000 character(s) maximum*

Liikmesriigil peab olema võimalus ise otsustada mis viisil väljamakse tarbijateni jõuab sh peab säilima võimalus suunata tulud taastuvenergia või elektrivõrkude arendamisse, kui see sotsiaalmajanduslikult pikas plaanis mõistlikum ja pikaajalises hinnakujundamises efektiivsem on.

What should be the duration of a two-way CfD for new generation and why? Should this differ depending on the technology type?

*2000 character(s) maximum*

Leping peaks olema lühem või piirduma ajaga, mil investering end ära tasub. Liikmesriigil peaks säilima paindlikkus tehnoloogiapõhiselt CfD kestvust määratleda.

Should generation be free to earn full market revenues after the CfD expires, or should new generation be subject to a lifetime pay-out obligation?

*2000 character(s) maximum*

Peale kahepoolse CfD lõppemist peab tootjal olema õigus teenida tulu lühiajaliselt turult. Kui tootjal keelatakse ära võimalus teenida kasumit peale kahepoolse CfD lõppemist, ei teki tootjal vabu vahendeid kahepoolsete CfDde väliselt tootmisüksuseid rajada, mistõttu võib tekkida pikaajaline olukord, kus turupõhiselt taastuvelektri tootmisseadmete rajamist ei toimu. On ka võimalus, et tootja on oma pakkumist tehes arvestanud peale kahepoolse CfD lõppemist saadava tuluga ja teinud seda eeldades madalama pakkumise. Kui tootja peale kahepoolse CfD lõppemist võimaliku tuluga arvestada ei saa, on tal vajadus kahepoolsel CfDde vähempakkumisel küsida suuremat hinda, mis tähendab seda, et kahepoolne CfD ei sõlmita optimaalsel hinnatasemel.

Without prejudice to Article 6 of Directive (EU)2018/2001[1], should it be possible for Member States to impose two-way CfDs by regulatory means on existing generation capacity?

[1]

Article 6 (1): Without prejudice to adaptations necessary to comply with Articles 107 and 108 TFEU, Member States shall ensure that the level of, and the conditions attached to, the support granted to renewable energy projects are not revised in a way that negatively affects the rights conferred thereunder and undermines the economic viability of projects that already benefit from support.

Article 6(2): Member States may adjust the level of support in accordance with objective criteria, provided that such criteria are established in the original design of the support scheme.

- ☐ Yes
- ☒ No

Do you have additional comments?

*2000 character(s) maximum*

Olemasolevad tootmisüksused on oma investeeringud juba teinud ja osalevad elektriturul hinnakujunduses. Olemasolevatele tootjatele kahepoolsete CfDde pakkumine ei täida oma eesmärki rajada uusi tootmisvõimsusi, ehk me ei kasuta kahepoolse CfD täielikku potentsiaali ära.

How would you rate the following potential risks as regards the imposition of regulated CfDs on existing generation capacity?

	Negligible risks	Low risks	Medium risks	High risks	Very high risks
Legitimate expectations/legal risks	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>
Ability of national regulators/governments to accurately define the level of the price levels envisaged in these contracts	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>
Locking in existing capacity at excessively high price levels determined by the current crisis situation	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>
Impact on the efficient short-term dispatch	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>

How would you address those potential risks as regards the imposition of contracts for difference on existing generation capacity?

*2000 character(s) maximum*

Would it be enough for existing generation to be subject only to a simple revenue ceiling instead of a revenue guarantee?

- ☐ Yes
- ☒ No

Do you have additional comments?

*2000 character(s) maximum*

Olemasolevate tootjate kasumi piiramine tekitab ebakindlust ja vähendab usaldust turu vastu investeringuid teostada.

What are the relative merits of PPAs, CfDs and forward hedging to mitigate exposure to short-term volatility for consumers, to support investment in new capacity and to allow customers to access electricity from renewable energy at a price reflecting long run cost?

*2000 character(s) maximum*

PPAd võimaldavad näiteks suurtarbijal või elektrimüüjal soetada elektrit fikseeritud hinnaga ehk maandada konkreetse tarbija hinnariski. Avalikul sektoril on võimalus ise PPAsid sõlmida, seeläbi turgu edendades. Eelistatud on finantstehingutel põhnevad PPAd, mis tagavad tootmise osalemise turuhinna kujundamises. Füüsilise tarnega seotud PPAd puhul ei osale turul tootja, ega tarbija kes kokkuleptud hinnaga elektrit soetab – üldjuhul füüsilise tarnega seotud PPAd turule mõju ei avalda, kuna eemaldavad turult nii nõudluse kui pakkumise, kuid tootmisseedme riknemisel või hooldamisel tuleb elekter siiski turult soetada. CfDde eesmärk seevastu on taastuvelektri tootmisüksuste rajamise toetamine ehk maandatakse tootjate riske. Kahepoolne CfD paneb paika tootja poolt toodetava elektri tulukuse piiri, mida ülatades tulu läheb näiteks riigile. Kahepoolse CfD puhul peab tootja kindlasti arvestama vajadusega teha tulevikuinvesteeringuid, mistõttu on fikseeritud hind tõenäoliselt kõrgem kui see oleks CfDga, mille raames tulupiir paigas pole. Tulevikutehingud võimaldavad tootjatel müüja oma toodangut kindla hinnaga ja elektrimüüjatel pakkuda tarbijatele fikseeritud hinnaga pakette ehk maandatakse hinnariske nii tootjale, müüjale kui tarbijale. Kõigil neil lepingutel esineb erinevaid variatsioone ja võimalusi lepingutingimusi muuta viisil, mis lepingu osapooltele kõige mõistlikum tundub. Elektrituru disain peab võimaldama erinevaid lepingutüüpe rakendada, ega ei peaks eelistama üht teisele – ainult sellisel viisil kujunevad turutingimustel lepingud, mille tulemusena lõpptarbija kõige enam võidab.

---

## Subtopic: Accelerating the deployment of renewables

---

The shortage in gas and electricity supply as well as the relatively inelastic energy demand have led to significant increases in prices and volatility of gas and electricity prices in the EU. As stated above, a faster deployment of renewables constitutes the most sustainable way of addressing the current energy crisis and of structurally reducing the demand for fossil fuels for electricity generation and for direct consumption through electrification and energy system integration. Thanks to their low operational costs, renewables can positively impact electricity prices across the EU and reduce direct consumption of fossil fuels.

Through the REPowerEU plan, the European Commission has put forward a range of initiatives to support the accelerated deployment of renewable energy and to advance energy system integration. These include the proposal to increase the renewable energy target by 2030 to 45% in the Renewable Energy Directive, legislative changes to accelerate and simplify permitting for renewable energy projects or the obligation to install solar energy in buildings.

These efforts should be accompanied by appropriate regulatory and administrative action at national level and by the implementation and enforcement of the current EU legislation.

Within the framework of the Electricity Market legislation, accelerating the deployment and facilitating the uptake of renewables is one of the guiding principles of the Clean Energy Package and of this consultation paper. For example, a transmission access guarantee could be envisaged to secure market access for offshore renewable energy assets interconnected via hybrid projects, where the relevant TSO(s) would compensate the renewable operator for any hours in which the actions of the TSO led to not enough transmission capacity being accessible to the offshore wind farm to offer their export capabilities to the electricity markets[1].

Also, removing the barriers for the uptake of renewable PPAs or generalising two-way CfDs, enhancing consumer empowerment and protection, and increasing demand response, flexibility and storage should contribute to the accelerated deployment of renewables.

[1] See the recommendations of the Study "Support on the use of congestion revenues for Offshore Renewable Energy Projects connected to more than one market" [https://energy.ec.europa.eu/system/files/2022-09/Congestion%20offshore%20BZ.ENGIE%20Impact.FinalReport\\_topublish.pdf](https://energy.ec.europa.eu/system/files/2022-09/Congestion%20offshore%20BZ.ENGIE%20Impact.FinalReport_topublish.pdf)

---

Do you consider that a transmission access guarantee could be appropriate to support offshore renewables?

- ☐ Yes  
☒ No

Please explain and outline possible alternatives.

*2000 character(s) maximum*

Me ei leia, et oleks mõistlik ja vajalik killustada taastuvelektri tootmisseedmetele antavaid toetusi, kuna see tekitab täiendavat keerukust hoida silma peab erinevatel subsiidiumitel ja hinnata nende mõju arendustele. Eestisse rajatavate meretuuleprakide puhul ei ole tõenäoline, et tuulepark vajaks alla koormamist ja sellisel viisil kompenseerimist.

---

Do you see any other short-term measures to accelerate the deployment of renewables?

	Yes	No
At national regulatory or administrative level	<input checked="" type="radio"/>	<input type="radio"/>

In the implementation of the current EU legislation, including by developing network codes and guidelines	<input checked="" type="radio"/>	<input type="radio"/>
Via changes to the current electricity market design	<input checked="" type="radio"/>	<input type="radio"/>
Other	<input type="radio"/>	<input checked="" type="radio"/>

If yes, please specify

*2000 character(s) maximum*

Do you have additional comments?

*2000 character(s) maximum*

At national regulatory or administrative level – riik saab näidata eeskju, soetades taasvuelektrit läbi PPAd. In the implementation of the current EU legislation, including by developing network codes and guidelines – taastuvelektri tootmiseseadmete loamenetluste kiirendamise põhimõtete tootmine valdkondlikesse EL õigusaktidesse.

Via changes to the current electricity market design – tänane turudisain toetab taastuvelektri seadmete rajamist. Oluline on hinnata kriisimeetmete mõju tootmiseseadmete rajamisele ja piirata selliste meetmete kehtivust lühima võimaliku tähtajaga.

How should the necessary investments in network infrastructure be ensured? Are changes to the current network tariffs or other regulatory instruments necessary to further ensure that the grid expansion required will take place?

*4000 character(s) maximum*

Võrkude arendamisel on oluline rakendada paindlikkusteenuseid sh salvestust ja ajapõhiseid tariife olukordades, kus võrguinvesteeringud palju kallimaks osutuksid. Regulatsioon peaks tagama, et jaotusvõrgu ettevõtetel on piisavad ressursid oma kohustuste täitmiseks sh piisavad oskused, digivõimekus ja finantsressursid. Näiteks oleks oluline täpsustada minimaalseid nõuded, millele jaotusvõrgu ettevõtte peaks vastama, nt võimekus oma võrku keskselt juhtida.

## Subtopic: Limiting revenues of inframarginal generators

During the current energy crisis, temporary emergency measures have been put in place under Council Regulation 2022/1854 of 6 October 2022 on an emergency intervention to address high energy prices. One of these measures is the so-called inframarginal revenue cap which limits the realised revenues of inframarginal generators to a maximum of 180 Euros per MWh. The aim of introducing this inframarginal cap was to limit the impact of the natural gas prices on the revenues of all inframarginal generators (new and existing) and to generate revenues allowing Member States to mitigate the impact of high electricity prices on consumers.

The question to be addressed in the context of the reform of the electricity market rules is whether, in addition to relying on long-term pricing mechanisms such as forward markets, CfDs and PPAs, such revenue limitations for inframarginal generators should be maintained.

---

Do you consider that some form of revenue limitation of inframarginal generators should be maintained?

- ☐ Yes  
☒ No
- 

How do you rate a possible prolongation of the inframarginal revenue cap according to the following criteria:

(a) the effectiveness of the measure in terms of mitigating electricity price impacts for consumers

5

(b) its impact on decarbonisation

0

(c) security of supply

0

(d) investment signals

0

(e) legitimate expectations/legal risks

0

(f) fossil fuel consumption

0

(g) cross border trade intra and extra EU

0

(h) distortion of competition in the markets

0

## (i) implementation challenges

### Do you have additional comments?

*3000 character(s) maximum*

Mõju on kõigile ülal loetletud tingimustele, eriti pikaajaliselt negatiivne. On vähendanud PPAd ja muude pikaajaliste lepingute sõlmimist ning nõrgestanud investeerimiskindlust.

---

### Should the modalities of such revenue limitation be open to Member States or be introduced in a uniform manner across the EU?

- ☒ Member States  
☐ EU

### Do you have additional comments?

*2000 character(s) maximum*

---

### How can it be ensured that any revenues from such limitations on inframarginal revenues are channelled back to electricity consumers? Should a default approach apply, for example, should these revenues be allocated to consumers proportionally to their electricity consumption?

*3000 character(s) maximum*

Tarbijate erisugused lepingud muudavad proportsionaalse jagamise keerukaks. Hinnalage ei ole mõistlik üleüldse seada, aga kui seda tehakse, peaks olema riigi otsustada, kuidas kogutud vahendid tarbijate heaks kasutusse võetakse. Võimalik, et tulud oleks mõistlik suunata võrkude, taastuvenergia või energiatõhususe arendamisse.

---

## Alternatives to Gas to Keep the Electricity System in Balance

Short-term markets enable trading electricity close to the time of delivery, covering day-ahead, intraday and balancing timeframes. Well-functioning short-term electricity markets guarantee that the different assets are used in the most efficient manner – this is key to deliver the lowest possible electricity prices to consumers. Short-term markets should therefore deliver relevant price signals reflecting locational, time-related and scarcity aspects: this will ensure the adequate reaction of generation and demand. Even if an increasing share of generation were covered by long term contracts such as PPAs or CfDs (cf. the sections above), the short-term markets would remain key to ensure efficient dispatch. The short-term markets also ensure efficient exchanges of electricity across borders.

Well-functioning short-term markets require healthy competition between market participants so that they are incentivised to bid at their true cost and regulators have the necessary tools to detect any kind of abusive or manipulative behaviour. Demand response, storage and other sources of flexibility must be put in a situation where they can compete effectively so that the role of natural gas in the short-term market to provide flexibility is progressively reduced, which will bring multiple benefits including lower electricity prices for consumers. To ensure this, targeted changes to the functioning of short-term markets could be envisaged, which could include:

#### *Incentivising the development of flexibility assets*

The Commission together with ACER has started the work on new rules to further support the development of demand response, including rules on aggregation, energy storage and demand curtailment, and address remaining regulatory barriers.

*Adapt incentives in the System operators tariff design:* The Electricity Regulation and Directive already give the possibility for system operators to procure flexibility services including demand response. However, in most Member States, the current regulatory framework treats capital expenditures (CAPEX) of system operators different from operational expenditures (OPEX), resulting in a bias in detriment of investments by system operators concerning the operation of their network. An alternative to this approach is a regulatory framework based on overall total expenditure (TOTEX), including capital expenditures and operational expenditures, which would allow the system operators to choose between operational expenditures and capital expenditures, or an efficient mix of both, to operate their system efficiently without bias for a certain type of expenditure. This would incentivise system operators to procure further flexibility services, and in particular demand response, which should be a key enabler for greater renewable integration.

*Using sub-meter data for settlement and observability:* The deployment of smart meters as envisaged in the Electricity Directive is delayed in several Member States. In addition, smart meters do not always provide the level of granularity required for demand response and energy storage. In these situations, it should thus be possible for system operators to use sub-meter data (incl. from private sub-meters) for settlement and observability processes of demand response and energy storage, to facilitate active participation in electricity markets (see also section “*Adapting metering to facilitate demand response from flexible appliances*” in the section on “**Better consumer empowerment and protection**”). The use of sub-meter data should be accompanied by requirements for the sub-meter data validation process to check and ensure the quality of the sub-meter data. Access to dynamic data of electricity consumed (and injected back to the grid) notably from renewable energy sources helps increasing awareness amongst the consumers and allows shifting demand towards renewable electricity.

*Developing new products to foster demand reduction and shift energy at peak times:* To foster demand reduction and energy shifting (through demand response, storage and other flexibility solutions) at peak times, a peak shaving product could be defined and considered as an ancillary service that could be bought by system operators. Such a product could be auctioned a few weeks/months ahead (with a capacity payment) and activated at peak load (with an energy payment), considering renewables generation, therefore contributing to phasing out gas plants from the merit order, and contributing to lowering the price. Demand reduced could also be shifted to another point in time, outside of peak times. This would incentivize flexibility when fossil fuel capacity is needed the most in the system. It would be important to ensure such a product is cost effective if implemented over the long term.

*Coordinating demand response in periods of crisis:* In periods of crisis, it would also be possible to combine the limitations of inframarginal revenues described in the section above with market-based coordinated demand response (reduction and/or shifting) in times of peak prices or peak load. The aim would be to reduce the market clearing price and fossil fuel consumption.

#### *Improving the efficiency of intraday markets*

*Shifting the cross-border intraday gate closure time closer to real time:* Intraday trade is a key tool to integrate renewable energy sources and balance their variability with flexibility sources up to real time. Wind and solar producers see their forecasts strongly improving close to delivery, and it should be possible to trade shortages and surpluses as close as possible to real time. Setting the cross-border intraday gate closure time closer to real time therefore appears as a meaningful improvement, in combination with maximising the cross-border trade capacity.

*Mandating the sharing of the liquidity at all timeframes until the time of delivery:* EU day-ahead and intraday electricity markets are geographically coupled, meaning that trades can take place anywhere across Europe if the grid cross-border capabilities are sufficient. This considerably increases the liquidity and therefore the efficiency of the markets. The Commission considers extending these benefits also to intra-border trade between different market operators. This would support competition development and facilitate market participants to balance their positions - a key aspect for integrating further variable renewables.

---

Do you consider the short-term markets are functioning well in terms of:

	Yes	No
(a) accurately reflecting underlying supply/demand fundamentals	<input checked="" type="radio"/>	<input type="radio"/>
(b) encompassing sufficiently liquidity	<input checked="" type="radio"/>	<input type="radio"/>
(c) ensuring a level playing field	<input checked="" type="radio"/>	<input type="radio"/>
(d) efficient dispatch of generation assets	<input checked="" type="radio"/>	<input type="radio"/>
(e) minimising costs for consumers	<input checked="" type="radio"/>	<input type="radio"/>
(f) efficiently allocating electricity cross-border	<input checked="" type="radio"/>	<input type="radio"/>

Do you see alternatives to marginal pricing as regards the functioning of short-term markets in terms of ensuring efficient dispatch and as regards the determination of cross border flows?

- ☐ Yes  
☒ No

Do you have additional comments?

*2000 character(s) maximum*

How can the EU emission trading system and carbon pricing incentivize the development of low carbon flexibility and storage?

3000 character(s) maximum

ETS süsteem muudab konkurentsivõimelisemaks vähese heitega tehnoloogiad sh juhitamatute võimsustega toodetud taastuvenergia salvestamise.

Do you consider that the cross-border intraday gate closure time should be moved closer to real time (e.g. 15 minutes before real time)?

- ☒ Yes  
☐ No

Do you have additional comments?

2000 character(s) maximum

Eestis pole tehnilisi takistusi päevasisese turu pakkumiste esitamise aja reaajale lähemale toomiseks. Muudatus võimaldaks teha päevasisese turu sulgemise ajaks reaalsusele rohkem vastavaid tehinguid.

Do you consider that market operators should share their liquidity also for local markets that close after the cross-border intraday market?

- ☒ Yes  
☐ No

What would be the advantages and drawbacks of sharing liquidity in local markets after the closure of the cross-border intraday market?

2000 character(s) maximum

Ressursi (nt paindlikkuse) jagamine erinevate turgude (lokaalsete ja ülepiiriliste) vahel loob suurema tulukuse võimaluse ressursi pakkujale ja stimuleerib seega pakkumiste paremat tulekut. Samas on probleemiks siiani olnud selguse puudus ja vähene koordineerimine erinevate turuoperaatorite vahel, näiteks kohalike turgude operaatorina jaotusvõrkude ja süsteemijuhtimise vaatest süsteemihaldurite vahel. Ideaalne oleks kui sama ressursi saaks pakkuda nii DSOdele kui TSOdele kasutamiseks, aga see eeldab korralikku reeglistikku ressursi jagamise osas ja sageli ka ühist platvormi koordineerimiseks.

Would a mandatory participation in the day-ahead market (notably for generation under CfDs and/or PPA's) be an improvement compared to the current situation?

- ☐ Yes  
☒ No

What would be the advantages and drawbacks of such an approach?

2000 character(s) maximum

CfDd ja PPA-d on juba täna motiveeritud turul osalema, mistõttu me ei näe kuidas täiendav kohustus olukorda parandaks. Ei leia, et sel lähenemisel oleks olulist mõju kummaski suunas.

What would be the advantages and drawbacks of having further locational and technology-based information in the bidding in the market (for example through information on the composition of portfolio, technology-portfolio bidding or unit-based bidding)?

2000 character(s) maximum

Asukoha info lisamine võimaldaks ressursi kasutamist reserviturgudel lokaalselt, näiteks jaotusvõrkude poolt, juhul kui ressurss pole juba kasutatud varasemates turuastmetes (päev-ette, päevasisene).

What further aspects of the market design could enhance the development of flexibility assets such as demand response and energy storage?

2000 character(s) maximum

Tarbimise juhtimist edendaks EL tasandil ühtse turukorralduse loomine.

In particular, do you think that a stronger role of OPEX in the system operator's remuneration will incentivize the use of demand response, energy storage and other flexibility assets?

- ☐ Yes  
☒ No

Do you have additional comments?

2000 character(s) maximum

Do you consider that enabling the use of sub-meter data, including private sub-meter data, for settlement/billing and observability of demand response and energy storage can support the development of demand response and energy storage?

- ☒ Yes  
☐ No

Do you have additional comments?

2000 character(s) maximum

Lisainfo kuvamine keskses andmelaos võimaldab turule tekkida täiendavatel paindlikkusteenustel (tarbimise juhtimine, salvestus). On oluline tagada, et ainult nõuetele vastavate arvestite info edastatakse platvormile ja oleks välistatud näitudega manipuleerimine

Do you consider appropriate to enable a product to foster demand reduction and shift energy at peak times as an ancillary service, aiming at lowering fuel consumption and reducing the prices?

- ☒ Yes  
☐ No

Do you have additional comments?

*2000 character(s) maximum*

Oleme varasemalt oma kirjas Euroopa Komisjonile väljendanud vajadust tarbimise juhtimine tuua päev-ette turule. Siiani on olnud probleemiks ühtse turumudeli nägemuse puudumine Euroopas, mis võimaldaks agregatoritel ja tarbimise juhtimises osalevatel tarbijatel oma paindlikkuse müügi eest konkreetset tulu saada. Üks võimalus selleks on luua päev-ette turule agregatoritele ajaaken tarbimise juhtimise pakkumiste tegemiseks. Antud lahenduse puhul avab elektribörsikorraldaja (NEMO) peale tootmis- ja tarbimispakkumiste vastu võtmise ajaakna sulgemist ajaakna tarbimise juhtimise pakkumiste tegemiseks. Tarbimise juhtimise pakkumised võimaldavad alandada nõudlust kindlatel kõrge hinnaga tundidel ja hinda alla tuua.

Euroopa Komisjon on välja pakkunud ka alternatiivse lähenemise, mille puhul süsteemihaldur hangib tarbimise juhtimise teenust vähempakkumiste teel pikemaks ajaks ette ja käivitab tarbimise juhtimise elektritarbimise tiptundidel, eesmärgiga elektrihinda vähendada. Eelistame varianti, mille kohaselt toimub päev-ette kauplemine, sh tarbimise juhtimine tsentraalselt ühtsetel kokku lepitud alustel ning tarbimise juhtimiseks oma paindlikkuse ressursi pakkuvad osapooled saavad osaleda vahetult turul nagu tootjadki. Alternatiivina näeme väärtust ka Euroopa Komisjoni poolt antud välja pakutud skeemil, mille puhul rõhutame, et päev-ette tarbimise juhtimise korraldamine TSO poolt eeldab läbipaistvat andmevahetust kõigi turuosalistega ja ühtset hinnastamise meetodikat tarbimise juhtijale kulude hüvitamiseks. On oluline, et tarbimise juhtimisest tekib hinnavõit lõpptarbijale. Ühtsed päev-ette tarbimise juhtimise turureeglid on mõistlik kokku leppida elektrituru regulatsiooni ulatuses.

Do you consider that some form of demand response requirements that would apply in periods of crisis should be introduced into the Electricity Regulation?

- ☐ Yes  
☒ No

Do you have additional comments?

*2000 character(s) maximum*

Me ei toeta ajutisena kokku lepitud meetmete alaliseks muutmist ilma pikaajalise mõju usaldusväärse eelhindangu tulemusi teadmata.

Do you see any further measure that could be implemented in the shorter term to incentivize the use of demand response, energy storage and other flexibility assets?

- ☒ Yes  
☐ No

If so, what would that be?

2000 character(s) maximum

Ühise turumudel loomine liidu tasandil (tuuroperatori alla). Reguleerimisturule oleks oluline võimaldada süsteemihaldurite poolt pikaajaliste lepingute sõlmimine.

Do you have additional comments?

2000 character(s) maximum

---

Do you consider the current setup for capacity mechanisms adequate to respond to the investment needs as regards firm capacity, in particular to better support the uptake of storage and demand side response?

- ☐ Yes  
☒ No

If not, what changes would you consider necessary in the market design to ensure the necessary investments to complement rising shares of renewables and to better align with the decarbonisation targets?

4000 character(s) maximum

Kehtiv regulatsioon ei võimalda tasakaalustamisturu tarbeks sõlmida pikaajalisi lepinguid, mistõttu pole tagatud pikaajaliselt reservvõimsuste piisavus ja nende rajamine. Teeme ettepaneku võimaldada süsteemihalduril sõlmida pikaajalisi (5-10 aastat) kahepoolseid lepinguid (CfD) päev-ette reguleerimisturul rakendamiseks.

Probleemiks on ka, et praegune turukorraldus ei toeta piisavalt juhitava võimsuse iseseisvat turule tulekut, seega juhitav võimsus tuleb põhiliselt läbi võimsusmehhanismi, eeskätt strateegilise reservi.

Võimsusmehhanisme käsitlevad ELi õigusaktid võiks muuta paindlikumaks, kuna on saanud selgeks, et võimsusmehhanismid on tulevase elektrituru ülesehituse tavapärane ja pidev osa. Praegune protsess võimsusmehhanismi rakendamiseks on väga aeganõudev ja ei võimalda kiireid meetmeid piisavuse toetamiseks ning seab seetõttu varustuskindluse ohtu.

Do you have additional comments?

4000 character(s) maximum

---

Do you see a benefit in a long-term shift of the European electricity market to more granular locational pricing?

- ☒ Yes  
☐ No

## Do you have additional comments?

3000 character(s) maximum

Baltikumi puhul on granulaarsus juba piisav ja pigem on küsimus, et peale sünkroniseerimist kui ülekandevõimsused on piisavad, peaks analüüsima võimalust Balti riikide pakkumispirkondade ühendamiseks.

---

## Better Consumer Empowerment and Protection

---

Union legislation recognizes that adequate heating, cooling and lighting, and energy to power appliances are essential services. The European Pillar of Social Rights includes energy among the essential services which everyone is entitled to access.

Union legislation also aims to deliver competitive and fair retail markets, as well as possibilities to reduce energy costs by investing in energy efficiency or in renewable generation thereby putting consumers at the heart of the energy system. The energy crisis has shown the importance of delivering on this ambition but also weaknesses in the existing system. For that reason, there is scope to further reinforce the Electricity Directive to deliver the needed consumer empowerment and protection, and avoid that consumers are powerless in the face of short-term energy market movements.

### *Increasing possibilities for collective self-consumption and electricity sharing*

Digitalisation – particularly when applied to metering and billing – facilitates energy sharing and collective self-consumption. Collective self-consumption means customers are able to invest in offsite generation and become “prosumers” reducing their bills just as if the renewable energy production installation were installed on their own roof. Consumers can then avoid buying gas produced electricity which leads to real decoupling.

The practical uses are potentially very significant – for example, families can share energy among the different members located in different parts of the country and farmers can install renewable generation on one part of their farm and use the energy in their main buildings even if located a distance away. Another clear use case is municipalities and housing associations can include off-site energy as part of social housing, directly addressing energy poverty.

Member States such as Belgium[1], Austria, Lithuania[2] Luxembourg, Portugal and others[3] have shown that it is possible to implement this model in practice quickly and at reasonable cost for consumers to develop energy sharing and collective self-consumption.

Customers should be in a position to deduct the production of offsite renewable generation facilities they own, rent, share or lease from their metered consumption and billed energy. Specific provisions could allow energy poor and vulnerable customers to be given access to this shared energy, for example produced within municipalities, or by investments of local governments.

Energy sharing should be treated in a non-discriminatory way compared to normal suppliers and producers. This means costs for other consumers are not unduly increased. Production and consumption has to happen at the same market time unit. Energy sharing be possible where there are no transmission

constraints for wholesale trade – that is within price zones.

#### *Adapting metering to facilitate demand response from flexible appliances*

The roll out and uptake of demand response has been slower than desired. One of the reasons for this has been the very complex relationships between suppliers and aggregators. The greatest demand response possibilities often come from individual appliances – in particular behind-the-meter storage, heat pumps and electric vehicles. Enabling dedicated suppliers and aggregators to offer contracts covering just these appliances could help both speed the roll out of these appliances and increase the amount of demand response in the system. The Electricity Directive already provides that customers are entitled to more than one supplier, but this has been seen to require a separate connection point increasing costs for customers significantly.

Therefore, there is a case for adapting the current provisions of the Electricity Directive to clarify that customers who wish to have the right to have more than one meter (i.e. a sub-meter) installed in their premises and for such sub-metered consumption to be separately billed and deducted from the main metering and billing.

#### *Better choice of contracts for consumers*

In many Member States as the crisis unfolded, the availability and diversity of contracts became more limited, making it increasingly difficult for customers to obtain fixed price contracts in many Member States. This was also often insufficiently clear to customers who believed that they had entered into fixed price contracts, alongside a wider lack of understanding of consumer rights.

There are also few “hybrid” or “block” contracts available. Such contracts combine elements of fixed price and dynamic/variable prices giving consumers certainty for a minimum volume of consumption but allowing prices to vary above that amount.

Customers with variable price contracts can find budgeting more difficult, particularly consumers on low incomes or vulnerable consumers. The effect of such contracts is that the cost of managing the risk of wholesale price increases is faced exclusively by customers and not by suppliers. On the other hand, variable prices – at least for the energy where the customer is effectively able to control consumption - can incentivise a more efficient use of energy.

While suppliers above a certain size are obliged to offer dynamic price contracts, which were less in demand during the crisis, the legislation is silent on fixed price contracts. This should be rebalanced to allow consumers a choice between flexible or fixed price contracts. Fixed price contracts could still be based on time of use to maintain incentives to reduce demand at peak hours. Suppliers would remain free to determine the price themselves.

Suppliers often argue that it is difficult to offer attractive fixed price offers for two reasons - firstly if they do not have access to longer term markets which allow them to hedge their risks. These issues are addressed in the sections on forward markets above. Secondly, suppliers argue that it is difficult to offer fixed price fixed term contracts because consumers are allowed to switch supplier (i.e. leave the fixed price fixed term contract) - leaving the supplier with additional costs. Currently, termination fees for fixed price fixed term contracts are allowed – but only if they are proportionate and if they reflect the direct economic loss to the supplier. Without abandoning these principles, it could be considered allowing regulators or another body to

set indicative fees which would be presumed to comply with these obligations.

### *Strengthening consumer protection*

#### *A) Protecting customers from supplier failure*

Increased supplier failure during the crisis, generally because of a lack of hedging, has been observed in several Member States. This has often resulted in all consumers facing higher bills because of socialisation of some of the failed suppliers' costs.[4] Customers of the failed suppliers are also faced with unexpected costs. Obliging suppliers to trade in a prudential way may involve some additional costs, but would reduce the risks that individual consumers face and also avoid socialisation of the costs of suppliers with poor business models. This is separate from, but complementary to, prudential rules applicable to energy companies on financial markets where the Commission has also taken action. At the same time, we recognise such obligations need to take account of the difficulties smaller suppliers face in hedging, particularly in smaller Member States (see also section on "*Forward Markets*" above).

All Member States have implemented a system of supplier of last resort, either de jure or de facto. However, the effectiveness of these systems varies and EU framework is very vague without clarifying the roles and responsibilities of the appointed supplier and the rights of consumers transferred to the supplier of last resort[5].

#### *B) Access to necessary electricity at an affordable price during crises*

The Electricity Directive includes specific provisions for energy poor and vulnerable customers, which are part of a broader policy framework to protect such consumers and help them overcome energy poverty.[6] However, the crisis has shown that affordability of energy can be a major issue not only for these groups, but also for wider sections of population. Member States can apply price regulation for energy poor and vulnerable households. Council Regulation (EU) 2022/1854 on an emergency intervention to address high energy prices allows for below cost regulated prices for all households and for SMEs on a temporary basis and subject to clear condition. In particular, such measures can only cover a limited amount of consumption and must retain an incentive for demand reduction. One of the lessons of the crisis is that the objective of reducing energy costs for consumer should not come at the expense of encouraging excess demand and fossil fuel lock-in, or fiscal sustainability. However, some form of safeguard to allow Member States to intervene in retail price setting might be needed for the future during a severe crisis, such as the current one. This could ensure that citizens have access to the energy they need, including ensuring that certain consumers have access to a minimum level of electricity at a reasonable price, regardless of the situation in the electricity markets, while avoiding subsidies for unnecessary consumption, such as heating of swimming pools[7]. This would also help ensure that when making large purchases, customers would take into account the full cost of energy. As the objective is to mitigate the impact of high prices during crisis periods, it would seem sensible to develop specific criteria to define a crisis in these terms. One alternative would be to link the Electricity Risk Preparedness Regulation, however this is focused on system adequacy, system security and fuel security, rather than mitigating the impacts of a crisis on users. Fossil fuel lock-in, however, needs to be avoided.

[3] Spain, Croatia, Italy ,France.

[4] For example, network charges owed to TSOs and DSOs and potentially imbalance costs.

[5] In particular, we would consider confirming that customers transferred to Supplier of Last Resort retain the right to change supplier within normal switching times (i.e. customers cannot be required to stay with the supplier of last resort for a fixed period); clarifying that the supplier of last resort must be appointed based on an open and transparent procedure; right of consumers to remain with supplier of last resort for reasonable periods of time.

[6] The Energy and Climate Governance Regulation together with the 2020 recommendation on Energy poverty provide a more structural framework to address and prevent energy poverty. The Fit for 55 legislative package further reinforces this framework through other sectoral legislation, through the revision of the Energy Efficiency Directive and the Energy Performance of Buildings Directive and through setting up of the Social Climate Fund to address the impact of the ETS extension to buildings and transport.

[7] This is also in line with the Recommendation on the economic policy of the euro area which called for a two-tier energy pricing model, whereby consumers benefit from regulated prices up to a certain amount

---

### Energy sharing and demand response

---

Would you support a provision giving customers the right to deduct offsite generation from their metered consumption?

- ☒ Yes  
☐ No

Do you have additional comments?

*2000 character(s) maximum*

Eestis on tarbijal juba täna võimalus oma arved ühendada. Leiame, et on vaja analüüsida, millised positiivsed mõjud selline muudatus täiendavalt tarbijale kaasa toob, võrreldes tänase süsteemiga. On oluline tagada, et sellise võimalusega kaasnevad ka vastavalt võrgust füüsiliselt tarbitavale elektrile ka võrgutasud.

If such a right were introduced:

(a) Would it affect the location of new renewable generation facilities?

- ☒ Yes  
☐ No

Do you have additional comments?

*2000 character(s) maximum*

(b) Should it be restricted to local areas?

- ☐ Yes  
☐ No

(c) Should it apply across the Member State/control/zone?

Yes

☐ No

Would you support establishing a right for customers to a second meter/sub-meter on their premises to distinguish the electricity consumed or produced by different devices?

☒ Yes

☐ No

If yes, what particular issues should be taken into account?

*2000 character(s) maximum*

Tuleb tagada, et arvesti vastaks nõuetele ja näitudega ei manipuleerita. Selliste arvestite paigaldamine võiks toimuda turupõhiselt.

Do you have additional comments?

*2000 character(s) maximum*

---

*Offers and contracts*

---

Would you support provisions requiring suppliers to offer fixed price fixed term contracts (ie. which they cannot amend) for households?

☐ Yes

☒ No

Do you have additional comments?

*2000 character(s) maximum*

Eestis pakuvad kõik müüjad tarbijatele ka fikseeritud lepinguid. Eraldi müüja kohustamine võib tuua tarbijale kaasa kõrgemad hinnad.

If such an obligation were implemented what should the minimum fixed term be?

*at most 1 choice(s)*

☐ (a) less than one year

☐ (b) one year

☐ (c) longer than one year

☐ (d) other

Cost reflective early termination fees are currently allowed for fixed price, fixed term contracts:

	Yes	No
(a) Should these provisions be clarified?	<input checked="" type="radio"/>	<input type="radio"/>
(b) If these provisions are clarified should national regulatory authorities establish ex ante approved termination fees?	<input type="radio"/>	<input checked="" type="radio"/>

Do you have additional comments?

*2000 character(s) maximum*

Do you see scope for a clarification and possible stronger enforcement of consumer rights in relation to electricity?

- ☐ Yes  
☒ No

Do you have additional comments?

*2000 character(s) maximum*

---

*Prudential supplier obligations*

---

Would you support the establishment of prudential obligations on suppliers to ensure they are adequately hedged?

- ☐ Yes  
☒ No

Do you have additional comments?

*2000 character(s) maximum*

Would such supplier obligations need to be differentiated for small suppliers and energy communities?

- ☐ Yes  
☐ No
-

Should the responsibilities of a supplier of last resort be specified at EU level including to ensure that there are clear rules for consumers returning back to the market?

- ☒ Yes  
☐ No

Do you have additional comments?

*2000 character(s) maximum*

Selguse huvides võiks üldine õigusraamistik paigas olla.

---

Would you support including an emergency framework for below cost regulated prices along the lines of the Council Regulation (EU) 2022/1854 on an emergency intervention to address high energy prices, i.e. for households and SMEs?

- ☐ Yes  
☒ No

(a) If such a provision were established, should price regulation be limited in time and to essential energy needs only?

- ☒ Yes  
☐ No

(b)

	Yes	No
Would such provisions substitute on long term basis for direct access to renewable energy or for energy efficiency?	<input checked="" type="radio"/>	<input type="radio"/>
Can this be mitigated?	<input type="radio"/>	<input checked="" type="radio"/>

(c)

	Yes	No
Would such contracts reduce incentives to reduce consumption at peak times?	<input checked="" type="radio"/>	<input type="radio"/>
Can this be mitigated?	<input type="radio"/>	<input checked="" type="radio"/>

Do you have additional comments?

Kriisimeetmeid ei tuleks rakendada tavaregulatsiooni osana.

---

## Enhancing the Integrity and Transparency of the Energy Market

---

Never has there been as much of a need as today to enhance the public's trust in energy market functioning and to protect EU effectively against attempts of market manipulation.

Regulation (EU) 1227/2011 on wholesale market integrity and transparency (REMIT) was designed more than a decade ago to ensure that consumers and other market participants can have confidence in the integrity of electricity and gas markets, that prices reflect a fair and competitive interplay between supply and demand, and that no profits can be drawn from market abuse.

In times of extra volatility, external actors' interference, reduced supplies, and many new trading behaviours, there is a need to have a closer look as to whether our REMIT framework is robust enough. In addition, recent developments on the market and REMIT implementation over last decade have shown that REMIT and its implementing rules require an update to keep abreast. The wholesale energy market design has evolved over the past years: new commodities, new products, new actors, new configurations and not all data is effectively reported. The existing REMIT framework is not fully updated to tackle all new challenges, including enforcement and investigation in the new market realities.

Current experience, including a decade of REMIT framework implementation (REMIT Regulation from 2011 and REMIT Implementing Regulation from 2014) and functioning show that REMIT framework may require improvements to further increase transparency, monitoring capacities and ensure more effective investigation and enforcement of potential market abuse cases in the EU to support new electricity market design. The following areas could be considered in this context:

- The alignment of the ACER powers under REMIT with relevant powers under the EU financial market legislation including relevant definitions, in particular the definitions of market abuse (insider trading and market manipulation);
- The adaptation of the scope of REMIT to current and evolving market circumstances (new products, commodities, market players);
- The harmonisation of the fines that are imposed under REMIT at national level and the strengthening of the enforcement regime of certain cases with cross-border elements under REMIT;
- Increasing the transparency of market surveillance actions by improved communication of the market-related data by ACER, regulators and market operators.

---

What improvements into the REMIT framework do you consider as most important to be addressed immediately?

ACERi juhendites (ACER Guidance on REMIT, Manual of Procedures (MoP) on Data Reporting), olevad olulisemad sätted tuleb muuta siduvaks liikmesriigile. Muidu võib tekkida olukord, kus ei loeta olulisi printsiipe REMITis siduvaks ja seetõttu võib kannatada REMITi juhtumid.

REMITis tuleb selgelt sõnastada, et see määrus on ülimuslik võrreldes andmete esitamisega esitamisega seotud nõuetega, mis tulenevad teistest elektrituru- ja gaasimäärustest.

Ühtlasi tuleks REMITis tõhustada piiriülest järelevalvet. Täna me näeme, et piiriülene järelevalve ei ole piisavalt tõhus.

With regards to the harmonization and strengthening of the enforcement regime under REMIT: what shortcomings do you see in the existing REMIT framework and what elements could be improved and how?

*4000 character(s) maximum*

With regards to better REMIT data quality, reporting, transparency and monitoring, what shortcomings do you see in the existing REMIT framework and what elements could be improved and how?

*4000 character(s) maximum*
